

1 (August 1, 2005)
2 Hazardous material excavation will be measured by the cubic yard. All excavated
3 material will be measured in the position it occupied before the excavation was
4 performed. An original ground measurement will be taken using cross-section or digital
5 terrain modeling survey techniques. The original ground will be compared with a survey
6 of the excavation area taken after the work is completed. The material will not be
7 measured when it taken out of stockpile and disposed of.
